

Status and Errata for the Spectral Preprint Stack

What stands, what is withdrawn (August 2026)

Corrected public record — August 2026

Abstract

This one-page note states which results from my 2026 spectral preprint stack I still claim, and which public claims I withdraw. It is not a prize announcement. Unconditional global regularity for classical three-dimensional Navier–Stokes is not claimed. The Riemann Hypothesis and the Goldbach conjecture are not claimed.

What stands (Tier 1)

Claim	Corrected note
Phi-renormalization: algebraic cancel $\frac{1}{r^4}\partial_z(\Gamma^2) = \partial_z(\Phi^2)$ for axisymmetric swirl; Q_1 -augmented framing	Phi-renorm submit note (Zenodo update of 20405405/20405597)
Ring Lemma (band-limited vorticity-direction bound) + SND as a <i>conditional</i> regularity criterion	Ring+SND submit note (update of 20518057 and related)
T2 shell-flux Gronwall <i>conditional on SND</i>	T2 submit note (update of 20552080; Goldbach material removed)
Bridge*: $R(e_p - e_q) > -1/2$ on normalized inverse-GCD for a single prime pair	New Bridge* note (not a full-spectrum floor)
Route C architecture <i>conditional on two analytic gaps</i>	Route C conditional note (update of 20518388; RH not claimed)

What is withdrawn

Withdrawn claim	Archive DOI (history only)
“Clay Statement (B) / Main Theorem proved” packaging	10.5281/zenodo.20405526
Quantum Lens as Millennium connector	10.5281/zenodo.20269843
Q6 dark-state $\Leftrightarrow$ Goldbach	10.5281/zenodo.20405589
Montgomery–Dyson “resolved” via Q6	10.5281/zenodo.20405593
Three-in-one / Triple Lock (SND $\equiv$ GNC $\equiv$ Bridge as unconditional closures)	10.5281/zenodo.20552171, ...20552400
Full-spectrum floor $\lambda_{\min} > -1/2$ for the named inverse-GCD matrices	Numerically false; do not cite as proved

On Q6

The inverse-GCD / “Q6” operator is a real matrix construction. The prize narrative built on it — that Q6 proves Goldbach, RH, or Navier–Stokes, or that a full-spectrum Bridge floor holds — does *not* stand. The corrected public write-up is the note *The Inverse-GCD Operator Q_N* (04.q6.inverse.gcd.tex): definitions, Bridge* (single prime-pair Rayleigh bound), nonnegative cone, and explicit withdrawal of false floors. Phi–Q6 “correspondence” is withdrawn as a load-bearing claim. Use that note as a new version of 10.5281/zenodo.20405589.

Break, not erasure

I am pausing this research line to work on products and anesthesia writing. The corrected Tier 1 notes are the public credit I want attached to my name. Older overclaim records remain as dated archive with this errata.
